AlphaChat

Private communication. Integrated payments. One ecosystem.

Enrico Maria Giaquinta

alias "Alpha"

Founder & Chief Architect

Enrico Maria Giaquinta, known by the pseudonym "Alpha", is an Italian entrepreneur, software architect, and technological innovator. With over 15 years of experience in blockchain technology, digital payment systems, and secure communications, he has designed and engineered numerous web platforms and digital infrastructure projects.

As the founder of AlphaBit and creator of AlphaChat, he leads the strategic vision, architectural design, and product evolution. His work is characterized by a low public profile, choosing instead to let the engineering and the robustness of his systems speak for themselves.

Beyond technology, he is the founder of Felinia, an independent initiative dedicated to the care and protection of stray cats, reflecting a personal commitment to social impact.

Engineering Philosophy

Simplicity

Technology should eliminate complexity, not create it.

Security

Data protection and privacy must be integrated from the architectural foundation.

Long-term Vision

Platforms must be designed to evolve without ever losing reliability.

*"Technology should never replace human relationships.
It should make them safer, simpler and freer."*

FOUNDER LETTER

To our future partners,

I started building AlphaChat because the way we communicate digitally is fundamentally broken. We have accepted a reality where our most intimate conversations are mined for data, where digital identity is rented rather than owned, and where sending value to a friend requires leaving the conversation to use a disconnected, often archaic, financial system.

The communication layer and the settlement layer should be the same space.

With AlphaChat, we are not just building another messaging app. We are building a secure, sovereign digital environment. By integrating the Signal protocol for end-to-end encryption and Polygon for instant, stablecoin-based settlement, we've created a seamless experience. Your messages are mathematically yours. Your money is cryptographically yours.

The AlphaBit ecosystem is designed for the long term. It is grounded in the belief that privacy is a right, not a feature, and that payments belong where relationships happen—inside the conversation.

This book details the architecture, the market positioning, and the vision. We invite you to look closely at the foundation we have built.

— Alpha

Why AlphaChat Exists

The narrative before the product.

01

The Fragmentation of Communication

Modern interactions are scattered across dozens of platforms. We message on one app, pay on another, and verify identity on a third. This friction degrades the user experience and slows down commerce.

02

Privacy as a Fundamental Right

The surveillance economy has commodified human interaction. We believe that privacy is not a luxury or an opt-in feature; it is the default state of free digital societies.

03

The Changing Digital Identity

Identity is moving from centralized databases to cryptographic self-sovereignty. Users demand control over who they are online and who can access their data.

Payments Belong Inside Conversation

Value transfer is essentially a form of communication. Moving money should be as instantaneous, secure, and native to a chat interface as sending a text message.

A unified application engineered for uncompromising privacy and integrated value transfer.

End-to-End Encryption

Built on the Signal protocol (X3DH, Double Ratchet, one-time prekeys). Multi-device support with strictly per-device sessions.

Encrypted Media & Storage

E2E encrypted media (AES-256-GCM per blob, Signal-wrapped keys). Encrypted local cache with E2E thumbnails.

Identity & Trust

TOFU (Trust On First Use) model. Verified through Safety Numbers, QR code verification, and key-change alerts.

Secure Calls

WebRTC with encrypted signaling, ICE restart resilience, and call verification against cryptographic key bundles.

Group Chats

Fully end-to-end encrypted via per-member Signal fan-out architecture.

Account Resilience

Recovery Card, Phoenix Protocol (emergency lock/destroy with argon2id-protected code), Dead Man Switch, recovery contacts, and full security timeline audit.

Progressive Web App

Installable, offline-tolerant, push notifications via VAPID, localized in 10 languages.

Zero-Knowledge Stance

The server acts as a blind relay and never sees plaintext. Metadata is strictly minimized.

The Payment Layer: USDA

Digital dollars, natively integrated.

USDA is an ERC-20 digital dollar stablecoin operating on the Polygon blockchain, acting as the native settlement asset inside AlphaChat.

In-Chat Escrow Engine

Send and request funds directly in conversation. Features a deposit → claim/release flow with on-chain verification, anti-replay protection, and atomic locking.

Non-Custodial Wallets

Users maintain complete control over their funds. Deep integration via WalletConnect/Reown supporting MetaMask, Rainbow, Coinbase, Trust, and Phantom.

Automated Gas Station

Frictionless UX with automated MATIC top-ups, abstracting away the complexities of blockchain network fees.

External Payment Links

Link-based payment requests powered by getusda.xyz, bridging external users into the AlphaChat payment layer.

The Ecosystem: AlphaBit

One coherent stack.

AlphaBit is the ecosystem. AlphaChat is the flagship consumer interface.

USDA is the native payment layer. AlphaBit Pay is the merchant infrastructure. They do not compete; they compound.

User

AlphaChat

USDA Rails

AlphaBit Pay

Merchants

— SYSTEM ARCHITECTURE

Edge encryption. Blind relays. Decentralized settlement.

Competitive Landscape

Positioning through objective architectural choices.

Messaging Platforms

PLATFORM	E2E DEFAULT	INDEPENDENCE	INTEGRATED PAYMENTS	SELF-SOVEREIGN RECOVERY
AlphaChat	Yes	Yes	Native (USDA)	Yes (Phoenix/Cards)
Signal	Yes	Yes	Limited (MobileCoin)	PIN based
WhatsApp	Yes	No (Meta)	Fiat/Regional	Cloud backup
Telegram	No (Opt-in)	Yes	TON integration	Centralized
iMessage	Yes	No (Apple)	Apple Pay (Fiat)	Cloud tied

Payment Processors

Traditional processors (Stripe, PayPal, Adyen, Square) focus on merchant checkout pages. AlphaChat shifts value transfer to conversation-native flows, bypassing traditional acquiring friction.

PLAYER	PRIMARY SURFACE	SETTLEMENT RAIL	RELATIONSHIP TO CONVERSATION
AlphaBit Pay + USDA	In-chat & merchant rails	Stablecoin on Polygon	Native — payment lives inside the conversation
Stripe	Merchant checkout & APIs	Card networks / bank rails	External — invoked from apps and websites
PayPal	Wallet & checkout buttons	Proprietary wallet + banks	Adjacent — P2P exists, separate from messaging
Adyen	Enterprise acquiring	Card networks / local rails	External — back-end processor for merchants
Square	POS & SMB commerce	Card networks	External — physical and online retail focus

Stablecoin Settlement

While USDC, USDT, and EURC are general-purpose market liquidity assets, USDA is optimized as an ecosystem-native settlement token on Polygon, engineered specifically for chat-based escrow and micro-transactions.

ASSET	PEG	PRIMARY ROLE	ECOSYSTEM POSITIONING
USDA	US Dollar	Ecosystem-native settlement	Purpose-built for in-chat escrow and AlphaBit Pay flows on Polygon
USDC	US Dollar	General market liquidity	Broad exchange and DeFi usage, regulated issuer (Circle)
USDT	US Dollar	General market liquidity	Largest trading-pair liquidity across exchanges
EURC	Euro	Euro-denominated liquidity	Euro settlement for European market flows

Sustainable economics powering free privacy.

01

Consumer Freemium

AlphaChat remains free for core communication. Privacy is never put behind a paywall.

02

Merchant Infrastructure

AlphaBit Pay serves as the revenue engine, charging predictable routing and settlement fees for commercial transaction flows (alphabitpay.com).

03

Payment-Flow Economics

Value captured through escrow services, automated gas abstractions, and cross-border settlement efficiencies.

SWOT Analysis

STRENGTHS

- Deeply integrated tech stack
- E2E depth & cryptographic rigor
- Clear Founder-led vision

WEAKNESSES

- Early stage adoption
- Lack of existing network effects
- Complex onboarding for non-crypto natives

OPPORTUNITIES

- Rising global demand for privacy
- Stablecoin mass adoption
- De-platforming risks on major networks

THREATS

- Incumbent feature cloning
- Evolving regulatory frameworks

- Wallet dependency friction

STRATEGIC ROADMAP

- **Phase 1: Foundation**

Core E2E protocol, PWA deployment, multi-device sync, and basic USDA integration.

Phase 2: Ecosystem Growth

Advanced Phoenix Protocol features, deeper WalletConnect integrations, and user acquisition.

Phase 3: Merchant Network

Rollout of AlphaBit Pay tools, external payment links, and commercial escrow APIs.

Phase 4: Open Platform

Developer SDKs, decentralized identity federation, and cross-chain settlement layers.

The Vision Forward

Alpha had a clear, uncompromising vision for digital sovereignty.

AlphaChat solves the fragmentation between private conversation and value transfer.

The AlphaBit ecosystem provides the scalable foundation for this new paradigm.
